QA–LOAD RUNNER–ADVANCE

Load Runner is a performance and load testing product for examining system behaviour and performance, while generating actual load. Load Runner can emulate hundreds or thousands of concurrent users to put the application through the rigors of real-life user loads, while collecting information from key infrastructure components (Web servers, database servers etc).

Working in Load Runner involves using three different tools which are part of Load Runner. They are Virtual User Generator (VuGen), Controller and Analysis.

To follow this course at IIBS, LOAD RUNNER BASIC course is pre- requisite for this LOAD RUNNER ADVANCE course.
